International application No. PCT/EP99/06581	International filing date (day/month/year) 07/09/1999	Priority date (day/month/year) 09/09/1998
International Patent Classification (IPC) or national classification and IPC B01J23/28		
Applicant UNIVERSITE LOUIS PASTEUR et al.		

1. This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36.

2. This REPORT consists of a total of 7 sheets, including this cover sheet.

- ☐ This report is also accompanied by ANNEXES, i.e. sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).

These annexes consist of a total of sheets.

3. This report contains indications relating to the following items:

- I ☒ Basis of the report
- II ☐ Priority
- III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- IV ☐ Lack of unity of invention
- V ☒ Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- VI ☐ Certain documents cited
- VII ☒ Certain defects in the international application
- VIII ☐ Certain observations on the international application

Date of submission of the demand 07/09/1999	Date of completion of this report 27.10.2000

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/EP99/06581

I. Basis of the report

1. This report has been drawn on the basis of (*substitute sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to the report since they do not contain amendments.*):

Description, pages:

1-14 as originally filed

Claims, No.:

1-26 as originally filed

Drawings, sheets:

1/2-2/2 as originally filed

2. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
- ☐ the claims, Nos.:
- ☐ the drawings, sheets:

3. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

4. Additional observations, if necessary:

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/EP99/06581

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Yes:	Claims
	No:	Claims 1-5, 12, 13, 26
Inventive step (IS)	Yes:	Claims
	No:	Claims 6-10, 11, 14-25
Industrial applicability (IA)	Yes:	Claims 1-26
	No:	Claims

2. Citations and explanations

see separate sheet

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

see separate sheet

Re Item V

Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Reference is made to the following documents:

- D1: EP-A-0 584 415 (UOP INC) 2 March 1994 (1994-03-02)
- D2: D.C. VERMAIRE ET AL.: 'The Preparation of WO₃/TiO₂ and WO₃/Al₂O₃ and Characterization by Temperature Programmed Reduction' JOURNAL OF CATALYSIS, vol. 116, no. 2, April 1989 (1989-04), pages 309-317, cited in the application
- D3: EP-A-0 152 918 (PHILLIPS PETROLEUM CO) 28 August 1985 (1985-08-28)
- D4: US-A-3 994 833 (JOUY MARCEL ET AL) 30 November 1976 (1976-11-30)
- D5: A. KATRIB ET AL.: 'Surface electronic structure and isomerization reactions of alkanes on some transition metal oxides' SURFACE SCIENCE, vol. 377-379, 20 April 1997 (1997-04-20), pages 754-758

- 1. The subject-matter of claims 1, 2, 3, 4, 5, 12, 13 and 26 does not meet the requirements of the PCT with respect to novelty, the reasons being as follows:

- 1.1 A catalyst according to claim 1, comprising, deposited on a TiO₂ support, metallic oxides of MO₂ type, prepared by the reduction of the corresponding MO₃ oxide, is already known from D1 (cf. claim 1 and page 1, line 40 - page 2, line 39), D2 (cf. abstract and page 310, "methods") or D3 (cf. claims 1 and 15 and page 4, lines 16-25)

Example 5 in D1 discloses tungsten oxide deposited on titania (anatase) catalyst. It is further supposed that W(VI) is converted to W(IV) in a reduction process (cf. page 3, line 40-43). Thus the subject-matter of claim 1 is already disclosed in D1.

D2 also discloses WO₂ on TiO₂: As shown on page 312-313, WO₃ is reduced to WO₂ during the temperature-programmed reduction.

As to the bifunctional character of the catalyst, the applicant explains that the two functionalities are provided by the support and the deposited metal respectively (cf. page 2 of the description). A catalyst consisting of the same support and the same metal as claimed in claim 1 is therefore considered to provide the same two functionalities.

- 1.2 The features of dependent claims 2, 3, 5 and 13 are known from D1:

For claims 2, 3 and 5, see claim 1

For claim 13, see page 3, line 29-30

The features of dependent claims 4 and 12 are known from D3:

For claim 4, see claim 1

For claim 12, see claim 3

- 1.3 As to claim 26, the use of a catalyst corresponding to claim 1 in the reaction of isomerization of unsaturated hydrocarbons is already disclosed in D3 (cf. page 1, line 4-9).

2. As to dependent claims 6, 7, 8, 9, 10 and 11, they do not appear to contain any additional features which, in combination with the features of any claim to which they refer, meet the requirements of the PCT with respect to inventive step, because they do not show any surprising effect.

3. The subject-matter of claims 14-26 does not meet the requirements of the PCT with respect to an inventive step, the reasons being as follows:

- 3.1 A process for obtaining a catalyst corresponding to claim 1, wherein the MO_3 oxides are reduced to MO_2 under a flux of a gas containing hydrogen, is known from D1 (cf. page 3, line 9-39), D2 (cf. page 310, "methods") or D3 (cf. page 5, line 18-24). The process according to claim 14 differs from that disclosure only in that the catalyst is produced by mixing and subsequent crushing of the mixture. This

feature is however a matter of normal design procedure (see e.g. document D4, example 4), which the skilled person would select, in accordance with circumstances, without the exercise of inventive skill, in order to produce a catalyst.

- 3.2 As to dependent claim 15 it does not appear to contain any additional features which, in combination with the features of claim 14, to which they refer, meet the requirements of the PCT with respect to inventive step, because they do not show any surprising effect.
- 3.3 A process for obtaining a catalyst corresponding to claim 1, wherein the TiO₂ support is impregnated by a M salt solution, the obtained product is calcinated in order to form MO₃ oxides and the MO₃ oxides are reduced to MO₂ under a flux of a gas containing hydrogen, is known from D2 (cf. page 310, "methods"). In the process according to claim 16 the crude support is washed, dried, calcinated, crushed and sieved before the impregnation step, whereas D2 only reveals crushing, sieving and subsequent washing of the support prior to impregnation. This difference does however not show any surprising effect that could contribute to an inventive step.
- 3.4 The features of dependent claims 17 and 24 are also known from D2 (cf. "methods"), as well as the feature of claim 21 (cf. page 311, fig.2). They could therefor not contribute to an inventive step.
- 3.5 As to dependent claims 18, 19, 20, 22 and 23 they do not appear to contain any additional features which, in combination with the features of any claim to which they refer, meet the requirements of the PCT with respect to inventive step, because they do not show any surprising effect.
- 3.6 As to claim 25, a catalyst corresponding to claim 1 is known from D1, D2 or D3. D5 reveals the catalytic activities of MoO₂ or WO₂ for isomerization and hydrogenolysis of a saturated hydrocarbon (cf. abstract and items 3.1 and 3.2). It would therefore be obvious to the skilled person to use the known catalyst, containing MoO₂ or WO₂ respectively, in a reaction according to claim 25.

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/EP99/06581

Re Item VII

Certain defects in the international application

1. It is not clear, whether claims 5 and 16 refer to MoO₃ or, more generally, to MO₃, because both expressions are used in the respective claims.
2. In claims 19 and 20 it is not clear what is meant by "to obtain WO₃ **then** WO₂" and "to obtain MoO₃ **then** MoO₂".
3. According to the requirements of Rule 11.13(I) reference signs not appearing in the description shall not appear in the drawings. This requirement is not met in view of the reference signs 9, 11, 12 and 13, in Fig. 1.

A polyvalent bifunctional catalyst and the process of realisation of such a catalyst.

The present invention concerns the field of catalysis, particularly the field of heterogeneous catalysis.

Its object is a catalysis system based on metallic oxides of the MO_2 type.

Its object is also the process of obtaining catalytic systems as well as the application of those systems in the chemical industry, especially in petro-chemistry, for the reactions of isomerization, dehydrogenation, hydrogenation and /or in hydrogenolysis of saturated and /or unsaturated organic compounds.

In the chemical industry, most reactions are accelerated by catalysts whose function is to allow the progress of those reactions under conditions of temperature and pressure which are economically profitable.

We already know four major types of catalysts in the field of heterogeneous catalysis or (contact catalysis) :

- The pure metals(4e, 5e, and the 6e periods of transition metals)
- The oxides of transition metals or of some heavy elements showing several stable oxidation states.
- The solid oxides of metals from the two first columns IA and IIA of the periodic table.
- The light metals and non-metals from columns IIIB, IVB, VB (acid oxides)

Within those different categories, we can distinguish two sub-categories according to their way of preparing this system: Bulk catalyst and supported catalyst, i.e. whose active phase is deposited on a support.

In the chemical industry in general, acid oxides (alumina, silica, often mixed, zeolites) catalyse mainly the hydration , isomerization, alkylation and cracking of organic molecules.

Certain oxides can catalyse at the same time redox reactions and acido- basic reactions: these are called bifunctional catalysts (reformation of fuels, synthesis of butadiene).

In the petrochemical industry in particular, the use of catalysts in the isomerization process, allows the obtaining of hydrocarbons with high octane number which can be used directly.

However, the catalysts used nowadays for the types of reactions mentioned above, still present a lot of inconveniences, some of which are important.

Indeed, a big part of the known catalysts contain noble metals such as platinum, paladium or iridium. The content, even if very small, of such metals in the

known catalysts, as well as the difficulties in recycling them, explain the very high prices of such systems.

Furthermore, research trying to replace those noble metals by cheaper metals in order to obtain new efficient catalytic compounds has not brought any really satisfying solutions up to now.

In particular, supported metallic catalysts, well-known for their activity in terms of hydrogenolysis and isomerization, have been the subject of studies on the substitution of noble metals by oxides of transition metals in particular.

However, the physico-chemical performances in terms of conversion, selectivity, life-time and recycling capability of the catalysts proposed at the end of these studies, are not always up to the industrial expectations, which is all the more prejudicial, as a good number of those new catalysts are often usable for a limited number of compounds and for specific reactions. Moreover, the development of a catalyst with the exact objective is generally uncertain, long and expensive.

As far as the bifunctional catalysts are concerned, one has to note that the acid character is brought by the support, which nowadays is usually an acid or chlorated alumina, eventually a zeolithe, whereas the metallic character is brought by a deposited metal. The necessary presence of two active substances leads to problems too, which are all the more important as these active substances are different, problems such as manufacturing, high costs, incompatibility between the materials and their treatment.....

The extensive hydrogenolysis properties of tungsten and molybdenum carbides have been clearly demonstrated by A.Katrib et al. *Cat. Lett.* 38(1996)95, and it has been shown that the presence of oxygen leads to the formation of oxycarbides WO_xCy type compounds which provide the isomerization catalytic properties to these new systems.

An identification, in particular by X-ray photoelectron spectroscopy of these new systems enabled to identify the active species as WO_2 and MoO_2 with isomerization properties (A.Katrib et al. *J. Electron. Spectro. Relat. Phenomenon.* 76(1995)195, and *J.Chim.Phys.* 94(1997)1923). On the other hand, the existence of the oxycarbide species WO_xCy has been excluded. Also, it has been shown that the W or Mo pure metals have hydrogenolysis properties, whereas the WO_3 and MoO_3 trioxides are catalytically inactive concerning saturated hydrocarbos.

Certain research on these trioxides deposited on alumina(W. Grünert et al. *J. Cat.* 107(1987)522) have shown that the support stabilises the oxide WO_3 in terms of a strong metal- support interaction. It is therefore difficult to form WO_2 , which is responsible for the catalytic activity on such a support.

In the isomerization catalysts, we can refer to the works of Martin (C. Martin et al. Cat. Lett. 49(1997)235) which describes the overall technical experiments allowing to characterize this type of catalysts. Moreover, Vermaire and Van Berge (J. Cat. 116(1989)309) have directed their work on the preparation of isomerization catalysts, emphasizing among others, the influence of the pH, which is less important in the case of TiO_2 than on Al_2O_3 . They also proposed a mechanism allowing to interpret the stoichiometric ratio 1:1 during the adsorption of the WO_3 on the sites Ti-O-Ti type, and they have shown the importance of a monolayer of WO_3 deposited on TiO_2 . According to them, this one corresponds to the maximum amount of tungsten which can accumulate on TiO_2 when it is placed for impregnation in a solution of pH=2. However, Rondon, Howalla and Herculs have established that this maximum quantity depends on the pH of the impregnation solution (Surf. Interface Anal. 26(1998)329).

The works of Yamaguchi, Tanaka and Tanabe (J. Cat. 65(1980) 442) have shown that the activity of catalysts based on tungsten studied in their work, reached a limit value for an initial content of WO_3 of 8% (molar). This quantity corresponds in fact to the triple of the formerly identified monolayer. They have also correlated activity to the acidity which occurs during the mixing of the two oxides TiO_2 and WO_3 . This acidity of Lewis type is interpreted by the accumulation of positive electrical charges on the tungsten according to the theory established by Tanabe et al. (Bull. Chem. soc. Japan 47(1974)1064). It is then possible, in the presence of water, to obtain the Brönsted acidity.

Finally, Hino and Arata (Bull. Chem. soc. Japan 67(1994)1472), have prepared solid superacid, by impregnating titanium hydroxide with WO_3 . It is not really a question of deposition of WO_3 on a support, since the support (TiO_2) is obtained by calcining the corresponding hydroxide after impregnation of the tungsten species. The application of these catalysts for the reactions of isomerization has not been considered.

The problem to be solved by the present invention consists therefore in supplying a bifunctional catalyst, which is cheap and stable in function of time, polyvalent and performing.

To this purpose, its object is a polyvalent bifunctional catalyst, characterized by the presence of MO_2 type phase, supported on TiO_2 . This MO_2 phase is obtained by the reduction of the corresponding MO_3 oxide(s). The metal(s) forming the MO_2 oxides are preferably chosen in the group formed by W and Mo.

The invention will be better understood due to the following description which relates to the preferred preparations, which are presented as a non-limited examples, and are explained with reference to the figures attached as enclosures:

Figure 1 represents in a schematic way, an example of installation of a reactor plant oriented toward the preparation and the study of the catalyst there after.

Figure 2 represents a diagram showing a comparison between the activities of the calcined and the non-calcined mechanical mixture of the catalysts C1 and C2 in function of the time of reduction using 2- methylpentane reactant.

Figure 3 represents a diagram showing the activity level and the stabilisation of the catalyst C4 using 2- methylpentane reactant.

According to the invention, the bifunctional polyvalent catalyst is formed by an oxyde or a mixture of oxides of MO₂ type, deposited on a support TiO₂. The oxides MO₂ being obtained by the reduction of the corresponding MO₃ oxides.

The metal(s) forming the MO₂ oxides are preferably chosen in the group formed by W or Mo so that the metallic oxide obtained by reduction on its support is the oxide of tungsten WO₂ or the oxide of molybdenum MoO₂. Of course, mixtures between the oxides of tungsten and molybdenum cited before are possible.

It has been found in a surprising and unexpected way, that a reduction in situ of the initial state of the commercial oxides, MO₃ and MO₂, is always necessary in order to observe a catalytic activity. Indeed, even by starting with the commercial dioxide MO₂ or the metal powder M, there is always a certain number of layers of the corresponding trioxide MO₃ present on the surface, which it is necessary to reduce to MO₂ in order to observe a catalytic activity.

As a non- limitative example, the isomerizing activity of WO₂ can be interpreted by the bifunctional character of this species, in similar way to the supported metallic catalysts.

Indeed, the dioxide behaves like platinum supported on acidic alumina, the W⁴⁺ (WO₂) species having two free electrons, in contrary to W⁶⁺.

The two free pre-cited electrons lead, from one side, to the formation of σ bonds between the aligned tungsten atoms in WO₂. On the other hand, it lead to the formation of π bonds between two tungsten atoms in two neighbouring sites in WO₂. The delocalisation of the π electrons acquire the metallic properties to the oxide, which enable the fonctions of hydrogenation and / or dehydrogenation and the dissociation of hydrogen (hydrogen molecule H₂).

The pre-cited electrons can be observed as a density of state at the Fermi-level in the X-ray and Ultraviolet photoelectron spectroscopy. Therefore it is possible to distinguish between the presence of two W-W bond lengths in WO₂, depending on the presence or not of the π bond. The protonation of the surface oxygen atoms leads to the formation of Brönsted acidic sites within the material. These acidic sites enable the isomerization functions, i.e. the displacement of the hydrocarbon chains.

-5-

The choice of TiO_2 as a support, is essential for the present invention, and it brings numerous important advantages to the catalytic compounds of the present invention.

Indeed, titanium dioxide is present in two crystalline varieties (A.D. Wadsley, rev. pure. Appl. chem. 5(1955)165), called rutile and anatase having a tetragonal structure with slightly different lattice parameters.

The inventors have noticed that the TiO_2 rutile structure corresponds to the WO_2 (deformed rutile structure) crystal structure. Therefore, the two oxides, TiO_2 and WO_2 have very close crystal structures with neighbouring geometrical parameters.

According to the present invention, the metallic oxide(s) MO_3 reduced to MO_2 can be deposited on the TiO_2 support alone, or TiO_2 supported on a substrate having larger surface area than TiO_2 .

We project for example, to deposit TiO_2 whose surface area is of the order of $57 \text{ m}^2/\text{g}$ on the surface of metallic oxides, preferably, SiO_2 , Al_2O_3 or a zeolite, where all these supports have surface areas of the order of $180 \text{ m}^2/\text{g}$.

The activation of the catalyst, by means of the reduction of the oxide MO_3 to MO_2 is an essential element of the present invention.

Indeed, initially, the metal, tungsten for example, is present in the state of trioxide MO_3 (catalytically inactive) in all the prepared catalysts. Those need therefore a reduction under hydrogen from MO_3 to MO_2 in order to activate the catalyst. This reduction process is realised directly in the catalytic reactor fig. 1.

In figure 1, one can see that the gases used are initially purified, by circulating on a first trap 2, which reduces the eventual traces of oxygen to water, which is trapped on a zeolite trap. The outputs are regulated with the help of a volumetric flowmeter 3 of type Tylan and a flowmeter of Brooks 4 for further control.

The gaseous flux circulates first of all through the compartment of reference of the catharometers 5, 5'. It goes then through a second trap 6, refrigerated by liquid nitrogen for example, at the passage of which an eventual injection of reacting hydrocarbons. The mixture which is made this way passes over catalyst 7, placed in an oven 8. The passage on the catalyst is monitored by two catharometers 5, 5', respectively placed before and after the oven 8. At the outlet of oven 8, a hydrogenator containing heated platinum Adams 10, enables to hydrogenate the unsaturated to saturated hydrocarbons which are analysed by gas chromatography. The physical parameters of the reaction of reduction (temperature, and pressure) are measured by the thermocouple T and the manometer P.

An advantageous realisation of the invention, is that the reduction takes place under a gaseous flux containing at least hydrogen at a temperatures between 380

and 550°C, for at least 6 hours, and a gas flux which ranges between 0.010 l/min and 0.050 l/min, preferably 0.030 l/min. and containing a volume ranging between 90% and 100% hydrogen, preferably 99% hydrogen. Under these conditions the catalytic activity stabilises within 6 hours.

In another way of realisation, which is particularly practical to determine the reduction temperature at which the catalytic activity stabilises, is for the reduction process to take place under a gaseous flux containing beside hydrogen, a gaseous hydrocarbon reactant which is going to be reacting on the catalyst. As non limitive examples, such gaseous hydrocarbon compounds, we mention 2-methylpentane, n-heptane, 4-methylpentene-1.

Also as an example, the gaseous hydrocarbon can be present in the mixture under a partial pressure ranging between 666.6 Pa(5 torr) and 1999.8 Pa(15 torr), preferably 799.9 Pa(6 torr).

In an advantageous manner, the MO₃ oxide(s) are deposited in atomic layers on a support material before being reduced into MO₂; that reaction does not affect the number of atomic layers.

In order to obtain the best catalytic results in terms of selectivity and conversion, the number of atomic layers of MO₂ present on the support material ranges between 1 and 8 layers, preferably 5. This corresponds in practice to catalysts containing from 5.4 % to 27 % of mass of MoO₃, which is the equivalent of 4.8% to 24% of mass of MoO₂ or between 6 % to 30 % of mass of WO₃ which corresponds to 5.7 % to 28 % of mass of WO₂.

In accordance with a first variation of realisation, a catalyst corresponding to the invention is obtained by a simple mechanical mixture of MO₃ and TiO₂.

So, according to a first process of obtention corresponding to the present invention we follow the following steps:

- Preparing a mechanical mixture of one or several MO₃ oxides with TiO₂ or TiO₂ deposited on a substrate presenting larger specific surface area than TiO₂ alone. The mixture having a metal M content ranging between 5 % and 25 %, and preferably 22 %.

- Crushing the obtained mixture in the first step.

- Reducing , preferably at 460°C, the deposited MO₃ oxide(s) to the corresponding MO₂ oxide(s) by the introduction of a gaseous flux containing at least hydrogen .

In this manner, the step of depositing the MO₃ oxide(s) is realised by mixing mechanically the crushed MO₃ oxide(s) with TiO₂ or TiO₂ deposited on a substrate presenting larger specific surface area than TiO₂ alone such as SiO₂.

We describe below in more details, an example of the process to obtain a catalyst according to the invention by mixing mechanically WO₃ with TiO₂.

The catalyst is obtained by crushing in a mortar a mixture of trioxide of tungsten which was calcined for 16 hours and dioxide of titanium (P25-Degussa).

Characterization of the support (TiO₂) :

Porous volum= 0.0005 l/g

Specific area= 50 m² / g

A first catalyst C1 has been prepared whose content in tungsten corresponds to an atomic layer of WO₃ deposited on TiO₂. The quantity of the WO₃ necessary , is determined on the basis of the parameters of the lattice structure of WO₃ according to the values given in table 1 as follows:

Table 1: Contents in oxydes and in metal for the catalyst C1.

	Masse [g]	Final content in oxide (% mass./ % mol.)	Masse of metal (W/Ti) [g]	Content in metal (% mass.)
TiO ₂	1	92,85 % / 97,5 %	0,599	55,66 %
WO ₃	0,077	7,15 % / 2,5 %	0,061	5,67 %
Total	1,077	100 %		

A second catalyst C2 has been prepared by calcining catalyst C1 for 16 hours at 500 °C. This treatment of calcination is similar to the treatment of calcination following the impregnation which will be described later. The study of these catalysts has allowed to understand the modifications which can occur during this step of calcination: sintering or diffusion of species in the solid state (Ceramic way).

In a second way of practical preferential realization of the catalyst according to the invention, is a catalyst deposited on a support.

This process of obtaining a catalyst according to this way of preparation is characterized by the following steps:

- Washing the raw support, drying and calcination
- Crushing the obtained solid followed by sifting(separation of particle sizes).
- Depositing the MO₃ oxide(s) on a support material made up of TiO₂ or TiO₂ deposited on a substrate presenting larger specific surface area than TiO₂ alone by impregnation of the support material with a solution of one or several salts of the metal M.
- Calcination of the obtained product to form MO₃ oxyde(s).
- Reduction, preferably at 510°C of the MO₃ oxide(s) by introducing a gaseous flux containing at least hydrogen on theMO₃ oxide(s).

-8-

In a preferred way, only the particles with a diameter ranging from 80 μm to 400 μm were conserved.

In accordance with the invention, the impregnation of the salt(s) of the metal M takes place between 2 to 4 hours, preferably 3 hours, at a temperature ranging from 50°C to 90°C, preferably 70°C.

In accordance with other characteristics of the invention, one of the salt(s) of tungsten or molybdenum could be used in order to obtain WO_3 then WO_2 or MoO_3 then MoO_2 , preferably $(\text{NH}_4)_{10}\text{W}_{12}\text{O}_{41} \cdot 5\text{H}_2\text{O}$ for W and $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$.

As will be explained in more details below, the impregnation of the support can be done under a controlled pH or not. Otherwise, according to another characteristic of the invention, the impregnation of the support occurs under a constant pH ranging between 1 and 4, preferably a pH equal to 2.

According to most preferred embodiment of the realisation which will be explained in more details further on, it can be foreseen that the salt solution is in excess with respect to the support volume which is evaporated after the impregnation in an oven at a temperature ranging between 80°C and 120°C, preferably at 100°C, for 10 to 14 hours, preferably 12 hours.

For all of these processes of obtention of the present invention, the number of atomic layers of MO_3 oxides deposited on the support ranges between 1 to 8, preferably 5 layers, and as for all catalysts, the metal(s) forming the MO_2 oxide(s) in the processes according to the present invention are preferably chosen in the group formed by W and Mo.

In the known processes of dry impregnation one dissolves the precursor in a solution which occupies exactly the porous volume of the treated support. Taking into account the small mass of TiO_2 used, and the small porous volume of TiO_2 (0.5 cm^3/g). A new process of a catalyst by using a technique of impregnation by excess solution is established in this invention.

Such a process of impregnation by excess of a solution is described in the work of Wang and Hall (J. Cat. 77(1982)232). It consists in eliminating by filtration the excess solution (ammonium paratungstate) which has been in contact with the support.

However, the inventors found that only an impregnation realized with a pH which is sufficiently acid, allows to observe a significative catalytic activity concerning the catalytic products studied in this work.

We are going to describe in more details an example of the process of preparation of a tungsten catalyst supported by wet impregnation at a non-controlled pH.

In this process, the solution containing the precursor occupies a volume which is much bigger than the porous volume alone. The quantities of ammonium paratungstate which are necessary for the deposit one or five layers of WO_3 , have been dissolved in distilled water; the solutions obtained that way, having been in contact with TiO_2 . There are two possibilities then:

For the catalyst C3 on which we wished to deposit an atomic layer, the excess of solution has been eliminated by filtration. The catalyst has been dried up in an oven (110°C) then calcined at 500°C .

For the second catalyst C4 on which to deposit the equivalent of 5 layers, the solution of impregnation has been eliminated by evaporation. This corresponds to the preferred variation of the impregnation process derived from the one proposed by Ipatieff et al. The catalyst has been then treated like the precedent one (drying and calcination). The quantities used as an example in catalyst C4 are given in table 2.

Table 2: The expected contents in oxides and metals present in catalyst C4.

	Mass (oxides) [g]	Content (oxides)	Masses (metal)[g]	content (metal)
TiO_2	1	72,2 %	0,599	43,24 %
WO_3	0,385	27,8 %	0,305	22,06 %
Total	1,385	100 %		

We noted for the catalyst C3 that the theoretical contents of tungsten have only partially been reached: The difference between the theoretical and experimental metal values allows to take into consideration the losses due to the use of this method in the case of the following preparation.

Another technique of impregnation by excess of solution at a controlled pH, is derived from the works of Rondon et al. as well as Wang et al.

We are going to describe below in a more precise way an example of a process of preparation of a tungsten catalyst supported by wet impregnation at a controlled pH.

Preparation of the support: The raw support is first of all washed. Then it is dried followed by calcination at 500°C . The obtained solid is crushed in a mortar; only the particles of diameters ranging from 80 to 400 μm are conserved.

Impregnation: The precursor of the used tungsten is ammonium paratungstate $(\text{NH}_4)_{10}\text{W}_{12}\text{O}_{41} \cdot 5\text{H}_2\text{O}$. The use of this salt allows to lead only to the formation of WO_3 after calcination.

Two solutions of ammonium paratungstate 0.005 M, whose initial pH were adjusted respectively to 4 and 2 were prepared by the addition of NH_4OH and 4M of HNO_3 . 40 ml of each of the two solutions were put in contact, at room temperature and stirred for 5 min., with 800 g of TiO_2 prepared as explained below:

We were careful to keep the initial values of the pH conserved during the whole duration of impregnation. After that period of impregnation of 3 hours at 70°C , the excess solution was eliminated by evaporation in an oven at a temperature of about 100 to 110°C for 12 hours. They were then calcined for 15 to 16 hours at 500°C . The catalyst C4 is then obtained from the second solution (pH=2) after reduction at 510°C for 40 hours.

One has to note that under those conditions, the concentration in metal of the solution of the metallic precursor varies a little during the impregnation. One can note, as an indication, that the fixation of an atomic layer of WO_3 leads to a loss in tungsten in the ammonium paratungstate solution of about 10%.

The best catalytic results have been obtained using catalysts prepared following the method described by "Ipatieff" (J. Am. Chem. Soc. 70(1948)533), in which the excess solution has been eliminated by evaporation.

Of course, the molybdenum catalyst is obtained by the same scheme as the one used in the example of tungsten catalyst.

Catalytical tests

In order to evaluate the capacities of the prepared catalysts, we have performed a series of catalytic tests using the catalytic reactor presented in figure 1, which is equally used for the reduction of the oxides.

A hydrocarbon such as 2-methylpentane has been used in order to determine the reduction temperature which is necessary in order to activate and stabilise the catalyst. The reaction temperature is always at 350°C , except when the reduction takes place at lower temperature: In this case, the reaction temperature is the same as the reduction temperature.

The added hydrocarbon to the hydrogen flux is injected in a refrigerated trap by the melted anisole (-37.5°C), which enables to obtain a partial pressure of the hydrocarbon at about 666.6 Pa (5 torrs). The used hydrogen flux is 0.03 l/min, in order to ensure a passage time of about 6 minutes for the hydrocarbon over the catalyst.

At the reactor exit, the mixture of the hydrogen and the hydrocarbon is analysed by in line gas chromatography. In this order, a capillary column of 50 m length and a 0.53 mm interior diameter was employed. This is diluted by helium (0.00122 l/min, which corresponds to 0.0927 m/s). The stationary phase is dimethylpolysiloxane.

The temperature program applied to the colon is composed of a first level of 20 min at 35°C , followed by a linear increase in the temperature of $25^\circ\text{C}/\text{min}$, then a third level at 110°C for 30 min.

The chromatograph used in this work is provided with a flame ionization detector, supplied by a mixture of air/hydrogen, and stabilized at 200°C, meanwhile the injector is maintained at 150°C.

The spectrum obtained by gas chromatography is analysed in order to calculate the product distribution, the selectivity and the activity as well as the rate of the reaction.

The study of the C1 and C2 catalysts obtained by mechanical mixture(the amount of tungsten corresponds to a monolayer of WO₃ on TiO₂)

The study of the catalysts behaviours in which we have applied levels of one hour at increasing temperatures, shows a significant activity at 460°C reduction temperature. As a result, these catalysts were studied in function of reduction time at 460°C.

The diagrams present in figure 2 represent the most interesting results concerning the catalyst before and after calcination for 12 hours at 500 °C.

Figure 2 shows also the influence of the calcination step in the preparation of the catalyst which is responsible for the lowering of the activity for longer periods of reduction. However, both catalysts C1 and C2 present a very high selectivity of about 90%.

Study of the the supported catalyst C3 (deposit of the equivalent of one monolayer of WO₃), obtained by impregnation at a non-controlled pH.

As in the precedent cases, the catalyst has first been treated at levels of one hour at increasing temperatures. The catalyst has thus been tested at temperatures ranging between 380°C and 700°C. However, the inventors did not found values of conversion which were comparable to those obtained by the catalyst C4 studied below.

For that matter it is suitable to note that fact to operate at temperatures as high as 700 °C can lead to the obtention of TiO₂ in the rutile state.

Study of the supported catalyst C4, obtained by impregnation at a controlled pH and by evaporation of the excess solution.

Catalytical tests (figure3) have also been realised under hydrogen flux, on 50 mg of catalyst, and a partial pressure pressure of 2-methylpentane of 893.3 Pa (6.7 torr). The reaction temperature at the beginning was 350 °C. In a first step, the evolution of the surface in function of the time of reduction up to 2400 minutes was studied. In figure 3, certain points of measurements correspond to temperatures of reduction different from 460 °C, that temperature being then reported on the diagram.

In a second step, the activity at successive levels, at decreasing temperatures from 500 to 250 °C was measured.

Otherwise, the activity of the catalyst C4 was also tested for the isomerization of 4-methylpentene-1(see table 4).

When the metallic mass was increased to 22% of tungsten, which is equivalent to 5 atomic layers (catalyst 4), the observed values for the conversion and

selectivity were 8% and 95% respectively. At an equal metallic mass, the impregnation of the support at an acidic pH enables to increase the conversion.

Furthermore, it is possible to reach all the values of conversion between 0 and 75% by varying the temperature of reaction between 300 and 500 °C.***This associates with a decrease in the selectivity in isomerization: At very low rates of conversion, the isomerization reaches 100%, whereas it is only 4.5% at 510 °C for a conversion of 75% (table3).

Once the catalyst is prepared under hydrogen at a given temperature of reduction, different products can be obtained for a given reactant by changing only the temperature of the reaction.

Example1 : Catalyst C4 (5 layers) prepared after reduction under hydrogen at 500 °C for 40 hours using 2-methylpentane.

The results are summarized in the following table:

Table 3: Evolution of the activity and the selectivity in function of the reaction temperature for the catalyst C4 (5 layers).

T reaction °C	Activity%	Selectivity in isomers%
350	8	95
330	3,6	97
300	1,2	100
315	2,3	98
380	12	81
350	8	94
400	15	68
420	16	49
460	26	15
510	75	4,5

The temperatures indicated in table 3 are classified in chronological order from top to bottom, the first temperature(350 °C) corresponding therefore to the first tested temperature of the reaction.

We can observe that returning to 350 °C (6th value) leads to the same values of activity and selectivity in isomerization (respectively 8% and 94% versus 8% and 95%), found for the reaction temperature during the first measurement: The catalytic system is therefore perfectly stable.

Example 2 : Catalyst C4 (WO₃, (5 layers)/ TiO₂; using 4-methylpentene-1 reactant

The results concerning the evolution of the activity and the selectivity in function of the reaction temperature for the catalyst C4 using 4-methylpentene-1 reactant are summarized in table 4.

Table 4 : Evolution of the activity and selectivity in function of the reaction temperature using catalyst C4.

T reaction °C :	Activity%	Selectivity in isomers%
350	58	92
250	57	90

As we can see from the results given in the following tables 5 and 6, that comparable results were obtained by using the MoO₃ / TiO₂.

Table 5: Conversions and selectivities of MoO₂, MoO₃, and MoO₃ / TiO₂ for the n-hexane reactant at different reaction temperatures. 1) = Commercial compounds prior to reduction; 2) = The initial state in order to obtain the catalyst by impregnation

Temp. de réaction °C	Conversions %			Selectivities %		
	MoO ₂	MoO ₃	MoO ₃ /TiO ₂	MoO ₂	MoO ₃	MoO ₃ /TiO ₂
	1)	1)	2)	1)	1)	2)
280	2,0	3,9	3,7	100	97,4	100
300	5,5	8,2	15,2	100	94,3	98,8
320	15,9	16,1	24,1	94,4	86,4	82,9
340	24,3	20,2	37,1	82,0	84,8	75,1
360	41,7	34,7	64,7	69,1	77,4	57,1
380	50,0	47,4	69,9	67,1	61,5	43,2
400	68,1	63,3	86,5	48,3	46,0	22,7

In the following table 6, the compounds C1 to C5 do not designate the catalysts of the present invention but the products of the reaction (five carbon atoms C5...) of n-hexane. On the other hand, the other abbreviations given in the table are: **22DMP** is 2,2-dimethylpentane, **23DMP** is 2,3-dimethylpentane, **2MP** is 2-methylpentane, **3MP** is 3-methylpentane.

Table 6: Products distribution obtained by the reaction of n-hexane on MoO₃ / TiO₂ at different reaction temperatures.

Products	Reaction temperatures °C						
Cracking	400	380	360	340	320	300	280
C1	26,2	18,1	13,5	8,7	6,1	0	0
C2	18,6	12,1	9,5	4	2,9	0	0
C3	19	14,7	10,7	6,1	3,6	1,3	0

C5	4,7	5,3	4,7	3,3	3	0	0
Isomerization							
22DMP	1	1,4	2	1,8	2,2	0	0
23DMP	2,3	4,3	5,5	6,3	6,1	6,3	7,3
2MP	11,1	22,3	30,3	41,7	47,3	59,7	64,4
3MP	7,7	14,9	19,7	25,4	27,7	34,8	36,4
2MP/3MP	1,5	1,5	1,5	1,6	1,7	1,7	1,8

The catalysts of the present invention are particularly useful in the field of organic chemistry and in particular in petrochemistry.

The catalysts described in the present invention can intervene in isomerization, dehydrogenation, and /or hydrogenolysis reactions of saturated organic compounds, in particular of alkanes as well as in the isomerization, hydrogenation, dehydrogenation, and /or hydrogenolysis reactions of mono or poly-insaturated organic compounds, in particular alkenes and alkynes.

Of course, the invention is not limited to the embodiments described and presented in the drawings given as enclosures. Modifications are possible, especially from the point of view of the use of different elements or by substitution of equivalent techniques, without being outside the field of protection of the invention.

CLAIMS

1. A polyvalent bifunctional catalyst, characterized by the fact that it comprises deposited on a support TiO_2 , an oxide or a mixture of metallic oxides of MO_2 type prepared by the reduction of the corresponding MO_3 oxide(s).
2. A catalyst corresponding to claim 1, characterized by the fact that the metal(s) forming the oxide(s) are chosen from the group formed by W and Mo.
3. A catalyst corresponding to claims 1 or 2, characterized by the fact that the metallic oxide obtained by reduction on the support is WO_2 .
4. A catalyst corresponding to claims 1 or 2, characterized by the fact that the metallic oxide obtained by reduction on the support is MoO_2 .
5. A catalyst corresponding to any of the claims from 1 to 4, which is characterized by the fact that the metallic oxide(s) MoO_3 which are reduced to MO_2 are deposited on a support TiO_2 which itself could be deposited on a substrate having larger surface area than TiO_2 .
6. A catalyst corresponding to claim 5, characterized by the fact that the said substrate is preferably SiO_2 , Al_2O_3 or a zeolite.
7. A catalyst corresponding to any of the claims from 1 to 6, characterized by the fact that the reduction process takes place under a gaseous flux containing at least hydrogen at temperatures between 380°C and 550°C , during at least 6 hours, at a flow rate between 0.010 l/min and 0.050 l/min, preferably 0.030 l/min, with a volum between 90% and 100% of hydrogen, preferably 99% hydrogen.
8. A catalyst corresponding to the claim 7, characterized by the fact that the reduction takes place under a gaseous flux containing hydrogen and a gaseous hydrocarbon compound which undergoes a chemical reaction using this catalyst.
9. A catalyst corresponding to claim 8, characterized by the fact that the gaseous hydrocarbon is present under a partial pressure range between 666.6 Pa and 1999.8 Pa, preferably 799.9 Pa.
10. A catalyst corresponding to any of the claims from 1 to 9, characterized by the fact that the oxide(s) MO_3 are deposited in atomic layers on a support before being reduced to MO_2 , this reduction process having no effect on the number of layers.
11. A catalyst corresponding to claim 10, characterized by the fact that the number of atomic layers of MO_2 present on the surface of the support ranges between 1 to 8, preferably 5.
12. A catalyst corresponding to any of the claims from 1 to 11, characterized by the fact that it contains in weight 5.4% and 27% of MoO_3 , which corresponds to 4.8% to 24% in weight of MoO_2 .

-16-

13. A catalyst corresponding to any of the claims from 1 to 11, characterized by the fact that it contains in weight between 6% and 30% of WO_3 , which corresponds to 5.7% to 28% in weight of WO_2 .

14. A process for obtaining a catalyst corresponding to any of the claims from 1 to 13, characterized by the fact that it contains the following steps:

- To prepare a mechanical mixture from one or many MO_3 oxides with TiO_2 alone or TiO_2 deposited on a substrate having larger surface area than TiO_2 , this mixture containing an amount of the metal M which varies between 5% and 25%, preferably 22%,
- To crush the mixture prepared in the previous step, and
- To reduce preferably at 460°C the oxide(s) MO_3 , thus deposited as corresponding MO_2 oxides under a flux of a gas containing at least hydrogen over the oxides MO_3 .

15. A process of realisation corresponding to claim 14, characterized by the fact that the step of depositing the oxide(s) MO_3 takes place by mechanically mixing the crushed MO_3 oxide(s) with TiO_2 or TiO_2 deposited on a substrate having larger specific surface area than TiO_2 .

16. A process for obtaining a catalyst corresponding to any of the claims from 1 to 13, characterized by the fact that it contains the following steps:

- To wash the crude support, followed by drying and calcination,
- To crush the obtained solid, then sieving it,
- To deposit the MoO_3 oxide(s) on the TiO_2 support or TiO_2 deposited on a substrate having larger surface area than TiO_2 by impregnating the so called support with a solution metal M salt(s),
- To calcinate the obtained product in order to form the MO_3 oxide(s), and
- To reduce preferably at 510°C the MoO_3 oxide(s) to the corresponding MO_2 oxides by passing a gaseous flux containing at least hydrogen over the MoO_3 oxide(s).

17. A process of realisation corresponding to claim 16, characterized by the fact that only the particles diameters vary between $80\text{ }\mu\text{m}$ and $400\text{ }\mu\text{m}$ are kept following sieving.

18. A process of realisation corresponding to claims 16 and 17, characterized by the fact that the impregnation of the metal M salt(s) takes place for 2 to 4 hours, preferably 3 hours, at temperatures between 50°C to 90°C , preferably 70°C .

19. A process corresponding to any of the claims 16 to 18, characterized by the fact that in order to obtain WO_3 then WO_2 a tungsten salt, preferably $(\text{NH}_4)_{10}\text{W}_{12}\text{O}_{41} \cdot 5\text{H}_2\text{O}$, is used.

20. A process corresponding to any of the claims 16 to 18, characterized by the fact that in order to obtain MoO_3 then MoO_2 a molybdenum salt, preferably $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$, is used.

21. A process corresponding to any of the claims 16 to 20, characterized by the fact that the impregnation of the support material takes place at a constant pH which is in the range between 1 and 4, preferably 2.

22. A process corresponding to any of the claims 16 to 21, characterized by the fact that the metal salt solution is in excess with respect to the support which is impregnated, the excess of the solution being evaporated in an oven after impregnation at temperatures in the range between 80°C and 120°C, preferably 100°C, for 10 to 14 hours, preferably 12 hours.

23. A process of realisation corresponding to any of the claims 14 to 22, characterized by the fact that the number of atomic layers of MO₃ present on the surface of the support ranges between 1 to 8, preferably 5.

24. A process of realisation corresponding to any of the claims 14 to 23, characterized by the fact that the metal forming the oxides MO₂ are selected in the group formed by W and Mo.

25. The use of a catalyst corresponding to any of the claims 1 to 13, possibly obtained by a process according to any one of claims 14 to 24, characterized by the fact that this catalyst is used in the reaction of isomerization, hydrogenation, dehydrogenation and / or hydrogenolysis of saturated hydrocarbons, especially alkanes.

26. The use of a catalyst corresponding to any of the claims 1 to 13, possibly obtained by a process according to any one of claims 14 to 25, characterized by the fact that this catalyst is used in the reaction of isomerization, dehydrogenation, hydrogenation and / or hydrogenolysis of mono or poly unsaturated hydrocarbons, especially alkenes and alkynes.

(54) Title: A POLYVALENT BIFUNCTIONAL CATALYST AND THE PROCESS OF REALISATION OF SUCH A CATALYST

(57) Abstract: The objective of the present invention is a polyvalent bifunctional catalyst and the process of its realisation. A catalyst characterized by the fact that it contains, over a TiO₂ support, an oxide or a mixture of metallic oxides of MO₂ type obtained by reduction of the corresponding MO₃ oxides, the metal(s) forming the MO₂ oxides are chosen from the group formed by W and Mo.

- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *G* document member of the same patent family

PATENT COOPERATION TREATY

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference B17871 JK/CL	FOR FURTHER ACTION see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. PCT/EP 99/ 06581	International filing date (day/month/year) 07/09/1999	(Earliest) Priority Date (day/month/year) 09/09/1998
Applicant UNIVERSITE LOUIS PASTEUR et al.		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 3 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

a. With regard to the language, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.

☐ the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

b. With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international search was carried out on the basis of the sequence listing:

☐ contained in the international application in written form.

☐ filed together with the international application in computer readable form.

☐ furnished subsequently to this Authority in written form.

☐ furnished subsequently to this Authority in computer readable form.

☐ the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.

☐ the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

2. ☐ Certain claims were found unsearchable (See Box I).

3. ☐ Unity of invention is lacking (see Box II).

4. With regard to the title,

☒ the text is approved as submitted by the applicant.

☐ the text has been established by this Authority to read as follows:

5. With regard to the abstract,

☒ the text is approved as submitted by the applicant.

☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the drawings to be published with the abstract is Figure No.

☐ as suggested by the applicant.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

☐ None of the figures.

INTERNATIONAL SEARCH REPORT

International Application No.

CT/EP 99/06581

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 B01J23/28 B01J23/30 B01J37/18

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 B01J

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X A	EP 0 584 415 A (UOP INC) 2 March 1994 (1994-03-02) page 2, line 41 - line 47 page 3, line 9 - line 43; claims 1,3-7; example 5	1-3, 10, 11, 13 19, 22-24
X	D.C. VERMAIRE ET AL.: "The Preparation of W03/T102 and W03/A1203 and Characterization by Temperature Programmed Reduction" JOURNAL OF CATALYSIS, vol. 116, no. 2, April 1989 (1989-04), pages 309-317, XP002102942 cited in the application page 310, column 1 -page 311, column 2 page 316, column 1 -column 2; figure 2; table 1	1-3, 10, 11, 13, 16, 17, 19, 21

-/-

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family
